SYNTHIA™

Retrosynthesis software that
augments your expertise

One of the most significant challenges in organic chemistry is finding viable synthetic pathways by painstakingly navigating the complex matrix of retrosynthetic possibilities while simultaneously accounting for what has been done, what could be done, and what starting materials are available.

Engineered by organic chemists and computer scientists over the course of 15 years, SYNTHIA™ harnesses the potential of advanced, highly nuanced algorithms powered by an ever-growing database of more than 100,000 hand-coded reaction rules.

SYNTHIA™ is easily customized to find the most relevant pathways for known and novel molecules based on your search criteria.

For each step, SYNTHIA™ takes the entire molecule into account going beyond local interactions to factor in potential conflict and selectivity issues, while providing stereoselective and regioselective reactions.

SYNTHIA™ explores novel and known solutions, eliminates nonviable options and presents the user with the most promising pathways to explore.

- **Simplify your discovery of novel pathways**
- **Save time and reduce costs**
- **Generate new ideas and intellectual property**
- **Design pathways that lead back to commercial starting materials**

Quickly go from imagining what's possible to testing what's probable
